

Less Student Aggression toward Teachers in Authoritative Schools

Our research found that teachers in authoritative schools report less student aggression toward them than teachers in other types of schools. As described in Issue 1, an authoritative school is one in which students report that their teachers are strict but fair in their discipline (high structure) *and* concerned and respectful toward them (high support). In contrast, there are schools with high structure but low support (authoritarian), high support but low structure (permissive), or low structure and low support (disengaged). Student aggression toward teachers was measured by surveying 9,134 teachers in 387 schools. Teachers were asked about five types of aggression, including verbal aggression, property theft, threats, physical attack, and threats with a weapon. The average levels of aggression across all teachers are reported in the first chart. The five types of aggression were summed into a total score for each teacher, and the average for all teachers in a school was used to determine each school's percentile. As shown in the second chart, authoritarian schools ranked at the 42nd percentile in level of student aggression in comparison to authoritarian (60th), permissive (56th) and disengaged (67th) schools. Comparisons of school types controlled for differences in size, poverty level, and minority composition of the student enrollment.

Practical Suggestions. Teachers do not have to choose between being strict versus being supportive with their students. The best strategy is to do both. Teacher discipline should convince students that they have high standards and are strict in their enforcement of school rules, but that they treat all students fairly. They should convey concern and respect for their students and a desire for all of them to do well. They should encourage them to seek help for problems or concerns such as bullying. Study Overview. The Virginia Secondary School Climate Survey (including scales from the Authoritative School Climate Survey) was administered as a component of the Virginia School Safety Audit program carried out by the Virginia Center for School Safety of the Department of Criminal Justice Services, in cooperation with the Virginia Department of Education. The survey was designed to yield practical information on school climate and safety conditions that can be used to improve conditions for learning. The survey was developed by researchers (P.I. Dewey Cornell) with the Youth-Nex Center to Promote Effective Youth Development and the Virginia Youth Violence Project of the Curry School of Education, University of Virginia. This project was supported by Grant #2012-JF-FX-0062 awarded by the Office of Juvenile Justice and Delinquency Prevention, Office of Justice Programs, U.S. Department of Justice. The opinions, findings, and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect those of the Department of Justice. This is a correlational study that can support, but not prove, causal relationships. More detailed analyses are available from the Virginia Youth Violence Project: <<http://youthviolence.edschool.virginia.edu/>>.
